

Big picture (super simple)

- Shopify is your “shop brain.” Your website shows products, adds to cart, and sends people to Shopify’s safe checkout.
- We already connected your site to Shopify. You just need to set up Shopify and paste 2 values into index.html.

What to do in Shopify (step-by-step)

1. Create your Shopify store
 - Sign up or open your store.
2. Turn on payments, currency, shipping
 - Settings → Payments: enable a payment method (for testing, turn on test mode or Bogus Gateway).
 - Settings → Markets → Currency: set to INR if you sell in ₹.
 - Settings → Shipping and delivery: add shipping rates.
3. Install “Buy Button” (optional but recommended)
 - Settings → Apps and sales channels → Add sales channel → Buy Button.
4. Make a sample product (we’ll use your BN161)
 - Products → Add product
 - Title: Eco-Friendly Instant Fabric Stiffener Spray
 - Price: 530; Compare-at price: 650 (optional)
 - SKU: BN161
 - Check “This is a physical product” and set a weight
 - Quantity/Inventory: add some stock
 - Status: Active
 - Sales channels: make sure Online Store (and Buy Button, if you added it) are enabled
 - Save
5. Make your B2B product (BN160)
 - Products → Add product
 - Title: B2B Eco-Friendly Fabric Sizing Agent
 - Price: 2500; Compare-at price: 3200 (optional)
 - SKU: BN160
 - Add stock, set weight, Status: Active, sales channels enabled
 - Save
6. Put products into a “website” collection (so they auto-appear on your site)
 - Products → Collections → Create collection
 - Title: website
 - Type: Automated (easiest)
 - Condition: Product tag is equal to website
 - Save
 - Go back to each product (BN160, BN161), add tag “website”, Save

- Check the collection handle:
 - In the collection page → View “Search engine listing” → Edit → Handle should be exactly: website. If not, change it to website.
- 7. Make a Storefront API token (this is safe to use on your site)
 - Settings → Apps and sales channels → Develop apps → Create an app
 - In the app, enable “Storefront API” and grant:
 - Read products, variants, collections
 - Manage checkouts (write checkouts)
 - Save, then copy the Storefront access token
- 8. Paste details into your site

Open index.html and set these lines (you already set the domain, now add the token):

```
const SHOPIFY_DOMAIN = 'm0vr7q-we.myshopify.com';
const SHOPIFY_STOREFRONT_TOKEN = 'PASTE_YOUR_STOREFRONT_TOKEN_HERE';
const SHOPIFY_COLLECTION_HANDLE = 'website';
```

- The buttons on your two static cards use SKUs BN160 and BN161. Keep those SKUs the same in Shopify or change the data-sku in the HTML to match.
- Any product you tag with “website” in Shopify will auto-appear in the “More Products” grid on your home page.

How it works for your shoppers

- They browse products on your site.
- Click “Add to Cart” keeps them on your site (floating cart).
- Click “Buy Now” or checkout in the cart opens Shopify’s secure checkout page to pay.

Quick test checklist

- Product BN161 is Active, has stock, on Online Store channel, SKU=BN161
- Product BN160 is set up similarly, SKU=BN160
- Collection “website” exists; both products tagged “website”
- Storefront token pasted and valid; domain correct
- Open your site → Products load under “Our Products” and the dynamic grid appears → Add to Cart → open cart → Buy Now leads to checkout

Shopify setup checklist

- Storefront API access token:

Created in Admin → Apps and sales channels → Develop apps → Your app → “Storefront API access”.

Ensure these access scopes are enabled: “Read products/product listings” and “Write checkouts” (Storefront: unauthenticated_read_product_listings, unauthenticated_write_checkouts).

- Product publication:

Products/variants must be published to the sales channels/apps used by your Storefront API (Manage sales channels and apps → ensure “Buy Button” and “Storefront API” are selected).

Variants must have the correct SKU set and be available/in stock.

- Collection handle:

website should be an existing collection handle if you rely on the dynamic section; not required for add-to-cart by SKU.

- Hosting:

Test over HTTP(S), not file://. Make sure no ad blocker blocks sdks.shopifycdn.com.

Publish products to the Storefront API sales channels in Shopify:

Go to Products in your Shopify Admin

Navigate to Products → All products

Click on the specific product (e.g., your BN160 or BN161 product)

Check Product Availability

Scroll down to the "Product availability" section

Look for "Sales channels and apps"

You should see checkboxes for various channels including:

Online Store ✓

Buy Button ✓ (This is crucial for Storefront API)

Point of Sale

Any other apps you've installed

Enable Required Channels

Make sure "Buy Button" is checked

If you don't see "Buy Button", it means the channel isn't added to your store yet
